This ebook is worth acquiring. Better then never, though i am quite late in start reading this one. You will not truly feel monotony at at any time of your own time (that's what catalogues are for about if you ask me).

Notice that the effect of multiplying the unit vector by the scalar is to change the magnitude from unity to something else, but to leave the direction unchanged. Suppose we wished to alter both the magnitude and the direction of a given vector. Multiplication by a scalar is no longer sufficient. Forming the cross product with another vector is also not sufficient, unless we wish to limit the change in direction to right angles. We must find and use another kind of mathematical entity. Lets pause to introduce some terminology. We will rename the familiar quantities of the previous paragraphs in the following way: Scalar: Tensor of rank 0. (magnitude only - 1 component) Vector: Tensor of rank 1. (magnitude and one direction - 3 components) This terminology is suggestive. Why stop at rank 1 Why not go onto rank 2, rank 3, and so on. 2 Dyad: Tensor of rank 2. (magnitude and two directions - 3 9 components) 3 Triad: Tensor of rank 3. (magnitude and three directions - 3 27 components) Etcetera . . . We will now merely state that if we form the inner product of a vector and a tensor of rank 2, a dyad, the result will be another vector with both a new magnitude and a new direction. (We will consider triads and higher order objects later.) A tensor of rank 2 is defined as a system that has a magnitude and two directions associated with it. It has 9 components. For now, we will use an example from classical electrodynamics to illustrate the point just made. 2 The magnetic flux...
